

cutting the probability map at two thresholds

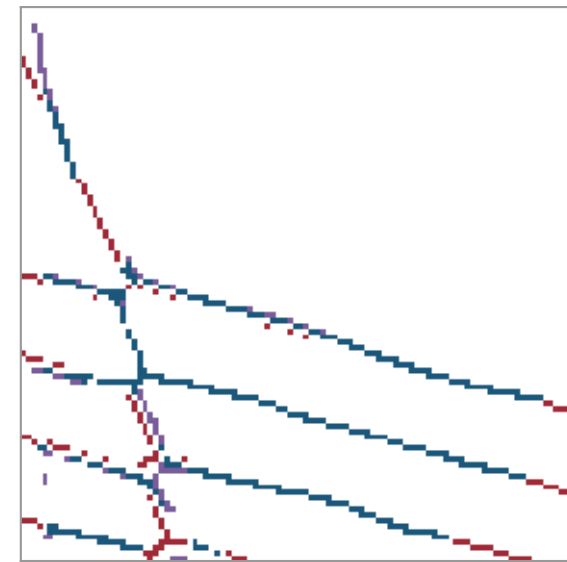

U-Net output
P(transition line)

$P > 0.7$ (chosen)
F1@1 0.792

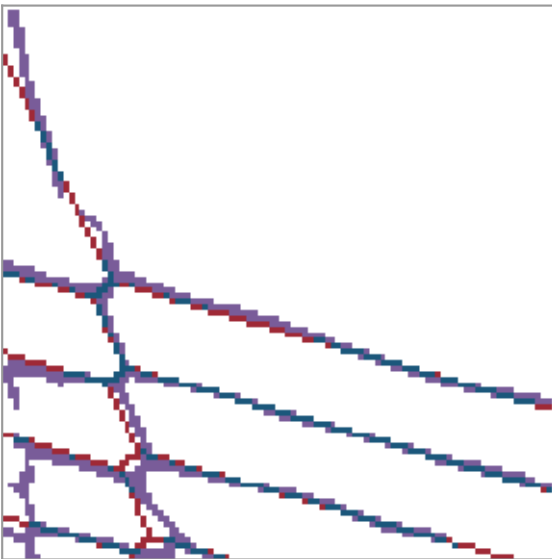

$P > 0.9$
F1@1 0.765

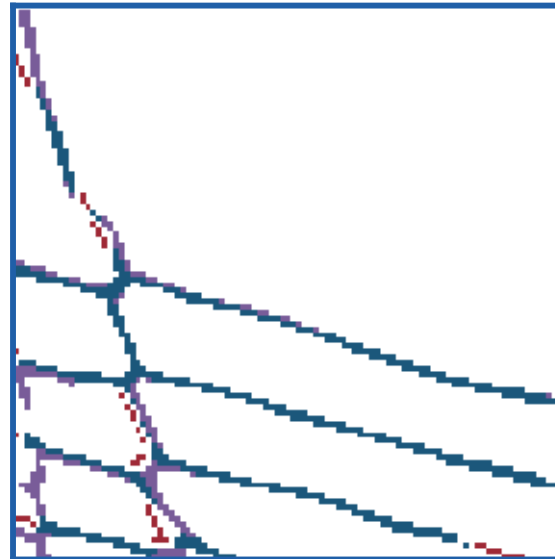

the SAME prediction ($P > 0.7$), scored at three tolerances τ — a predicted pixel counts as correct when a true line lies within τ pixels

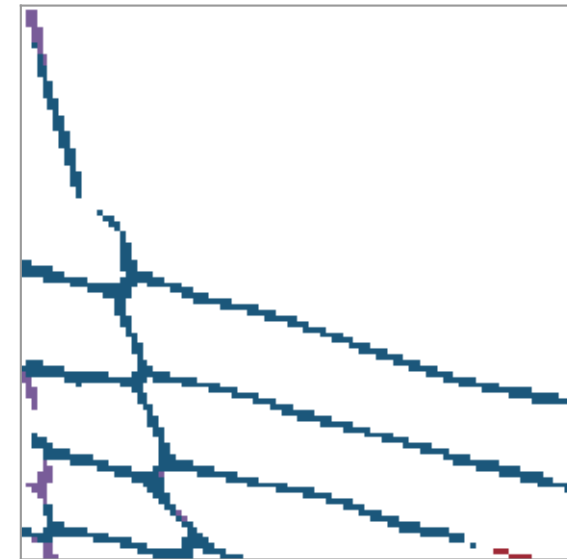

$\tau = 0$ strict
F1@0 0.428

$\tau = 1$
F1@1 0.792

$\tau = 3$
F1@3 0.955

■ found — a predicted line that really is there

■ missed — a real line the model did not draw

■ false — a line drawn where there is none
