

capacitances drawn at random
for each simulated device

sparse measurement:
a fan of rays from one corner

capacitances varied

exact transition lines from
the charge configuration

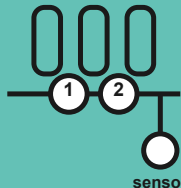

Simulated devices

constant-capacitance simulator

the network is trained
on the simulated diagrams

U-Net

intended application

the two input channels:
sampled signal, sampled mask

Measured device

a fabricated double dot in a dilution refrigerator

not demonstrated in this work

probability map of the
transition lines
